

Rotator

The new way to quickly and safely turn bundles of structural steel 90 degrees

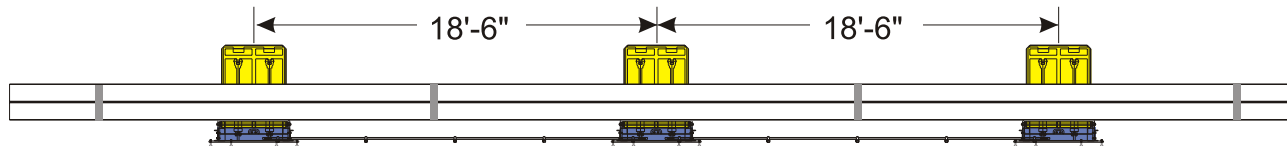

**STEEL

SYSTEMS**

The Rotator performs an awkward task in seconds without risk to the operator or the handling equipment.

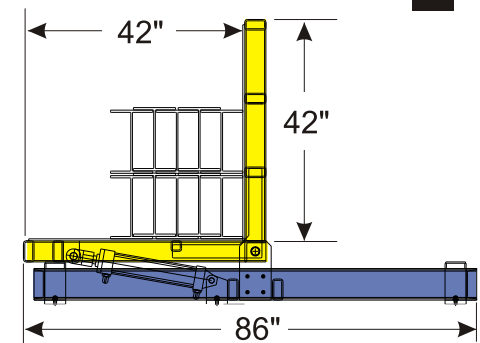

The Rotator is principally designed to turn mill bundles of beams so the web is horizontal for conventional stacking. It can also be used for stacking bundles and rotating rectangular tubing. The cycle time is less than 30 seconds and there is no wasted motion since the Rotator is functional in both directions. There is no need to unhook the slings while turning the loads, either, further expediting the handling. In addition to being fast and safe, the Rotator eliminates wear and tear to chains and the crane that can be very costly.

There are three hydraulically powered stands, each with 4,000 lbs. capacity, and spaced to handle 20' to 60' material.
